                                                                                                                                          RNA was isolated from mycellum of P. infestens DDR7602 cultured for 4 weeks in synthetic medium. EST clones were named by their position in the microtiter plate, preceded by the prefix MY (for mycelial) and the successive number of the microtiter plate (e.g. MY-06-A-04)."

It is one of 10 enzymes (see also AAW19734-35 and AAW19737-43) predicted to be involved in D-desosamine or L-mycarose biosynthesis and attachment that have been identified from gene clusters (AAT72684 and AAT72685) of Saccharopolyspora erythraea. No glycosylattion-modified polyketides are produced by selectively altering, inactivating or augmenting the eryB and/or eryC genes encoding these sugar biosynthesis enzymes and introducing them into
                                                                                                                                                                                                                                                                                                                                                                                                                             Gene cluster; bacterium; enzyme; macrolide; antibiotic; erythromycin; secondary metabolite; eryBII; eryCIII; eryCIII; hybridisation; probe;

This gene cluster encodes enzymes involved in the production of the macrolide antibiotic erythromycin as a secondary metabolite. The erythromycin gene cluster spans approximately 53 kb and contains at least 20 open reading frames (ORF). The genes are used to produce hybrid secondary metabolites in S.erythraea, i.e. erythromycin analogues which may have improved properties or as hybridisation probes for isolating homologous genes involved in glycosylation of macrolactones in macrolide-producing strains (specifically oleandomycin-producing strains of Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid sequences encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       performing biotransformations on macrolide compounds including avermectin or other macrolide aglycones. The sequences are also useful in vivo in a bacterial host, in vitro in combination with an actinomycete fermentation, and in vitro in combination with enzymatically active polypeptides that are not from the avermectin biosynthetic pathway to effect the synthesis of a pharmaceutically active compound, e.g. an antibiotic. Sequences AAB61973-981 represent polypeptides in the avermectin biosynthetic pathway, involved in the synthesis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           methodology. The gene and the encoded polypeptides together with other enzymatically active polypeptides, are useful to perform combinatorial biocatalysis in vitro and in vivo in a host cell. They are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a 10 kb genomic DNA isolated from S. avermitilis that contains genes encoding proteins for glycosylation of avermectin aglycones. The polypeptides can be expressed by standard recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure;

cc pyrolinic producing enzyme. The method of preparation of an isopremoid compound comprises using at least 1 DNA, a vector, cloned cells, their derived recombinant DNAs or transformed products in a culture system and extracting the isopremoid accumulated in the medium. The DNA encodes at least 1 of the following: (a) a compound for activating or catalysing the production of 1-deoxy-D-xylulose-5-phosphate from pyruvic acid and collycerylaldehyde-3-phosphate; (b) an enzyme producing farnesyl pyrolinic acid; (c) a protein which elevates the efficiency of synthesis of compounds and comprises a 3. or 4 amino acid sequence coptionally with 1 or more of the amino acids being deleted or substituted or an additional amino acid being inserted; (d) a protein which activates or catalyses the production of 2-C-methyl-D-crythreitol-composhate from 1-deoxy-D-xylulose-5-phosphate; or (e) a protein which activates a target compound or reaction and is a string end or hybrid of the DNA encoded in (a)-(e). Isopremoid compounds are useful in drugs (e.e.g. for the treatment of heart diseases, osteoporosis and hemostatis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-APR-1998;

```
This polypeptide sequence Kv beta 1 consists of the core region of a CC beta-subunit of a Shaker-like potassium ion channel (SPC). This core region can bind to a polypeptide consisting of the N-terminal A and B CC with the core of the NAB-S1 (the first transmembrane spanning domain) linking region of the Alpha-subunit of SPC. The polypeptides or the culcleic acid encoding them can be introduced into the cytoplasm of a cell to modulate the flow of potassium ions through a cytoplasmic cell membrane. Potassium ion channels regulate the action potentials, cardiac pocemaking and neurotransmitter release in excitable tissues. In CC non-excitable tissues they play important roles in hormone secretion, cell proliferation, cell volume regulation and lymphocyte differentiation. Molecules which bind to the alpha or beta-subunit polypeptides can be detected by contacting the polypeptides. With a putative core region of a beta-subunit respectively, and determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polypeptide(s) derived from Shaker-like potassium ion channel alpha and beta subunits - used to alter potassium ion levels in a cell, e.g. for treating neurological disorders, tumours, metabolic disease
                                                                                                                             whether or not binding occurs. These polypeptides and the encoding nucleic acids may be useful in the treatment of a huge variety of disorders, e.g. neurological disorders, tumours, metabolic diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 15; Pages 51-52; 106pp;

CC AAF71360 to AAF71750 encode the Corynebacterium glutamicum sugar CC metabblism and oxidative phosphorylation (SMP) proteins given in CC AAB79243 to AAB 79633 which are involved in carbon metabblism and CC energy production. The C. glutamicum SMP gene can be used in vectors CC (II) for expression in host cells and production or modulation of CC production of fine chemicals, such as, an organic acid, a proteinogenic CC or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, CC antcleoside, a nucleotide, a lipid, a saturated or unsaturated fatty CC acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a CC cofactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins CC (III) encoded by them are used for diagnosing the presence or activity of CC corynebacterium diphtheriae in a subject. (I), (II), (II) or Nost cells CC containing them are used to map genomes of organisms related to CC glutamicum, identify and localise C. glutamicum sequences of interest, in evolutionary studies, in determining SMP protein regions required CC in evolutionary studies, in determining SMP protein regions required CC metabolism of sugars, and in modulating high-energy molecule production cc in a cell (i.e. ATP, NADPH).
                                                                                                                                                                                                                                                                                                           Best Loc

                                                                                                                                   Вþ
                                                                                                                                                                  Š
                                                                                                                                                                                                                                                                                                                                     This polypeptide sequence KV beta 2 consists of the core region of a beta-subunit of a Shaker-like portassium ion channel (SPC). This core region can bind to a polypeptide consisting of the N-terminal A and B box (NAB) domain and the NAB-S1 (the first transmembrane spanning domain) linking region of the alpha-subunit of SPC. The polypeptides or the nucleic acid encoding them can be introduced into the cytoplasm of a cell to modulate the flow of potassium ions through a cytoplasmic cell membrane. Potassium ion channels regulate the action potentials, cardiac pacemaking and neurotransmitter release in excitable tissues. In non-excitable tissues they play important roles in hormone secretion, cell proliferation, cell volume regulation and lymphocyte differentiation. Molecules which bind to the alpha or beta-subunit polypeptides can be detected by contacting the polypeptides, with a putative NAB and NAB-S1 linking region of an alpha-subunit or with a putative core region of a beta-subunit respectively, and determining nucleic acids may be useful in the treatment of a huge variety of disorders, e.g. neurological disorders, tumours, metabolic diseases,
                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                             comprising a preliminary screening for microorganisms with low or no 5S clavam production; (4) a microorganism which is capable of 5R clavam production and low or no 5S clavam production obtainable by a process as in (3); (5) clavulanic acid (CA) obtainable by the fermentation of a microorganism as in (4), and (6) CA which is free of any 5S clavam; (7) CA which is free of any clavam; 2-carboxylate. The methods and products can be used to produce organisms capable of producing increased amounts of clavams suitably e.g. CA, for use as antibiotics. The methods can also be used for the production of CA without the production of 5S
                                                                                                                                                                                        The present sequence represents the protein sequence of a gene specific for 5S clavam biosynthesis from Streptomyces clavuligerus (SC) and which is not essential for 5R clavam biosynthesis. The present invention also describes: (1) a process for improving 5R clavam production in a suitable microorganism comprising manipulation of DNA encoding as above and its inclusion in the microorganism; (2) a process for improving 5R clavam production in SC comprising disrupting or otherwise making defective DNA regions flanking cas 1; (3) a process for the identification of a microorganism suitable for high 5R clavam production
                                                                                                                                                                                                                                                                                                                                                                                                    DNA comprising defective 5S clavin biosynthesis gene(s) from Streptomyces clavam - useful for producing clavulanic acid w

            The present sequence represents a cell wall protein, designated 6 Candida albicans. The cell wall peptides and their corresponding antibodies are useful for treated their corresponding as well as for preventing or detecting infection of any yeast type. These include opportunistic and nosocomial infections. The peptides are also useful in the development of peptidomimetics an

The antibodies are effective inhibitors of hydrophobically mediated pathogenesis events. They are also useful in diagnostic tests (i.e. detect, diagnose and serotype yeast infection), and for detecting the presence of Candida and other pathogenic yeasts, in a biological sample. Furthermore, they may be used as research and development tools.
